

Nowhere in either study does the reported effect reappear

Markers are means; bars are 95% percentile bootstrap CIs over seeds. The 9.24-point value has no interval: it came from a single image scored by a 37-line script, with the compared models trained for 1, 50 and 30 epochs on three different tasks.

Study 1's interval is wider because n = 10; study 2 registered n = 58. Study 1's row is D — A because arm A (plain U-Net, one output) exists only there; study 2 dropped it, so its reference is B_wide, the capacity-matched control. The axis is broken between 2.75 and 9.0 points.
