

At the registered noise level the only arm that separates from the control is D, and only on the heart

Paired across the 58 registered seeds; reference is B_wide, the capacity-matched single-decoder control (10,743,738 parameters against D's 10,811,298, a 0.62% difference). Error bars are 95% percentile bootstrap CIs over seeds (100,000 resamples). Both panels share one y axis, so the two channels are directly comparable.
